

Algorithm 1 Grid Dispatch & DMA Injection (Running on AMB82-Mini)

Require: K_{config} : Kernel Configuration (Dimensions, Opcode)

Require: T_{global} : Global Tensor Data (Weights/Inputs) stored in DDR

Ensure: G_{bus} : Global G-BUS Data Stream (To ESP32)

- 1: **Initialize** DMA_{eng} with burst size 512 Bytes
 - 2: **Divide** T_{global} into memory tiles $\{t_0, t_1, \dots, t_n\}$ fit for L2 SRAM
 - 3: **for all** tile t_i in T_{global} **do**
 - 4: {Step 1: Send Metadata Sideband}
 - 5: **Push** $Meta(t_i)$ to Metadata Buffer (Shape, Precision)
 - 6: SetSignal(MD_Valid, High)
 - 7: {Step 2: Trigger Hardware Engine}
 - 8: **while** Signal(G_BUSY) == High **do**
 - 9: **Wait** {Flow control: Block until ESP32 Buffer is Free}
 - 10: **end while**
 - 11: {Step 3: Zero-Copy Transfer}
 - 12: $DMA_{src} \leftarrow Address(t_i)$
 - 13: $DMA_{dst} \leftarrow G_BUS_PORT$
 - 14: DMA_Start() {Drives 8080 Bus}
 - 15: **Wait** for DMA_{IRQ} (Transfer Complete)
 - 16: **end for**
 - 17: {Step 4: Kernel Launch}
 - 18: SendPacket(CMD_LAUNCH)
-
